

Dear Editor-in-Chief,

We are pleased to submit the revised manuscript entitled "A Real-Time Haptic Simulation Prototype for Liver Lesion Localization Training: System Design, Technical Feasibility Validation, and Formative Expert Evaluation" by Siyu Wang, Yunxiu Xu, and Shoichi Hasegawa for consideration for publication in IEEE Access.

This research addresses a technical bottleneck in medical training: the integration of physics-based computation into a real-time haptic loop. By adopting a group-based corotational finite element method (GB-CFEM), we established a closed-loop system between large-deformation computation and force response on consumer-grade hardware.

Given the interdisciplinary nature of our work, which bridges real-time haptic rendering interfaces, computational biomechanics (specifically finite element modeling for soft tissue), and virtual reality-based medical simulation systems, we believe it will resonate with researchers and domain experts operating at the intersection of these fields. We hope this prototype provides valuable insights into the technical feasibility of physics-driven haptic palpation tasks for the broader IEEE Access readership.

We confirm that this manuscript has not been published previously and is not currently under consideration for publication elsewhere. All authors have approved the final revised manuscript and agree with its submission to IEEE Access.

Thank you for your time and continued consideration of our work.

Sincerely,

Siyu Wang
